Thermohaline circulation (THC) is a part of the large-scale ocean circulation that is driven by global density gradients created by surface heat and freshwater fluxes. The adjective thermohaline derives from thermo-referring to temperature and -haline referring to salt content, factors which together determine the density of sea water. Wind-driven surface currents (such as the Gulf Stream ...

Introduction to Intraself Basins . Isolated intraself basins (ISBs) are carbonate systems that punctuate the carbonate sedimentary sections of intracratonic plates throughout the Phanerozoic. These intraself basins are the product of carbonate depositional systems responding almost instantaneously to fill accommodation space caused by relative sea level change.
